과목	정보보호
교수님	류재철 교수님

1. 과제 이해

이번 과제는 지난 과제에서 이용했던 `pycrypto` 모듈의 `AES` 를 사용하여 네트워크를 통한 메시지 발신/수신 시 `CBC` 암호/복호화를 수행하는 것입니다.

`AES_CBC` 는 블록 암호 방식의 암호화/복호화를 진행하므로 짧은 메시지를 암호화/복호화하기에 알맞습니다.

2. 과제 구현

a. Server 및 Client

```
#!/usr/bin/python3
import socket
import MCipher as MCipher

def server_program():
    host = '127.0.0.1'
    port = 5461

    key = 'thisisbadkeykeythisisbadkeykey'
    iv = 'ivisinitialvetor'

    server_socket = socket.socket()
    server_socket.bind((host,port))

    server_socket.listen(2)
    conn, address = server_socket.accept()
    conn.send(key.encode())
    print(conn.recv(1024).decode())
    conn.send(iv.encode())
    print(conn.recv(1024).decode())
    cipher = MCipher.setAES(key, iv)

    print("Connection from: " + str(address))

    while True:
        rdata = conn.recv(1024)
        if not rdata:
            break
        data = MCipher.AES_Decrypt(cipher, rdata).decode()
        print("Recieved from user2 : " + str(data))
        data = input(' -> ')
        conn.send(MCipher.AES_Encrypt(cipher, data))

    conn.close()

if __name__ == '__main__':
    server_program()
```

```
#!/usr/bin/python3
import socket
import MCipher as MCipher

def client_program():
    host = '127.0.0.1'
    port = 5461

    keyReceive = False
    client_socket = socket.socket()
    client_socket.connect((host, port))

    if(keyReceive == False):
        key = client_socket.recv(1024).decode()
        print('key : ' + key)
        client_socket.send('key exchange Success'.encode())
        iv = client_socket.recv(1024).decode()
        print('iv : ' + iv)
        client_socket.send('iv exchange Success'.encode())
        keyReceive = True
        cipher = MCipher.setAES(key, iv);

    if(keyReceive):
        message = input(' -> ')
        while message.lower().strip() != 'bye':
            client_socket.send(MCipher.AES_Encrypt(cipher, message))
            data = client_socket.recv(1024)
            data = MCipher.AES_Decrypt(cipher, data).decode()
            print('Received from user1 : ' + data)

        message = input(" -> ")
        client_socket.close()

if __name__ == '__main__':
    client_program()
```

Server 및 Client 파일입니다. Server 및 Client 에서 각각 전송 시 암호화, 수신 시 복호화 처리를 해 두었습니다.
